Models of the subsoil of the Netherlands and Flanders

Project area - Roer Valley Graben

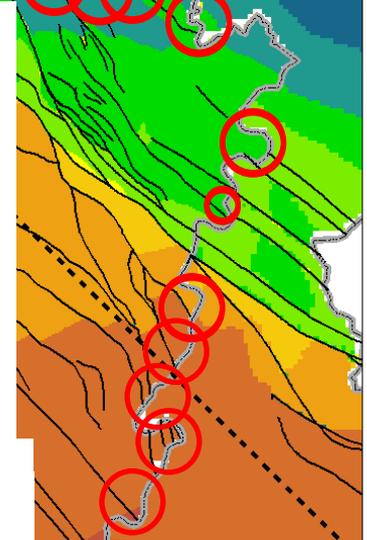

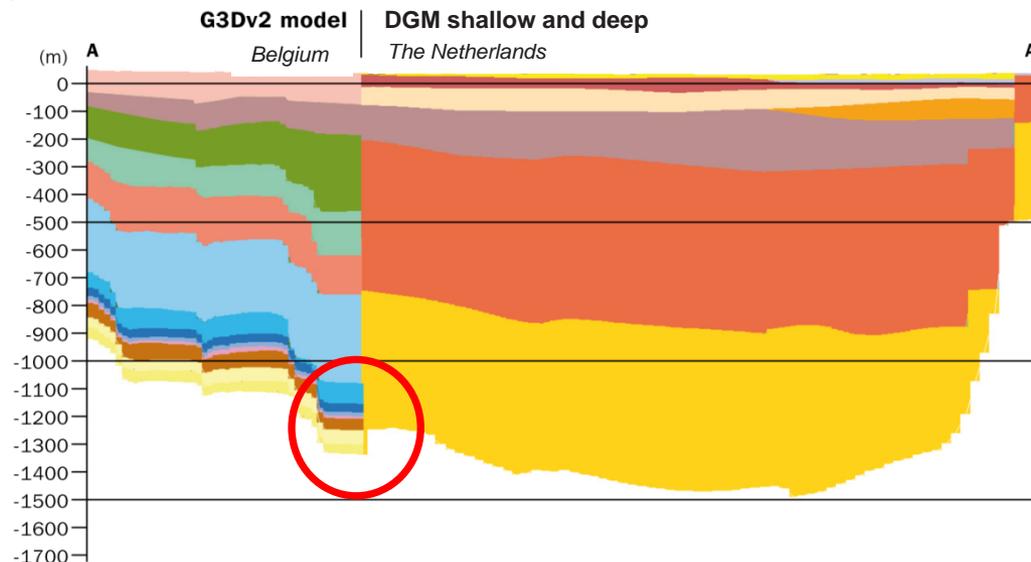

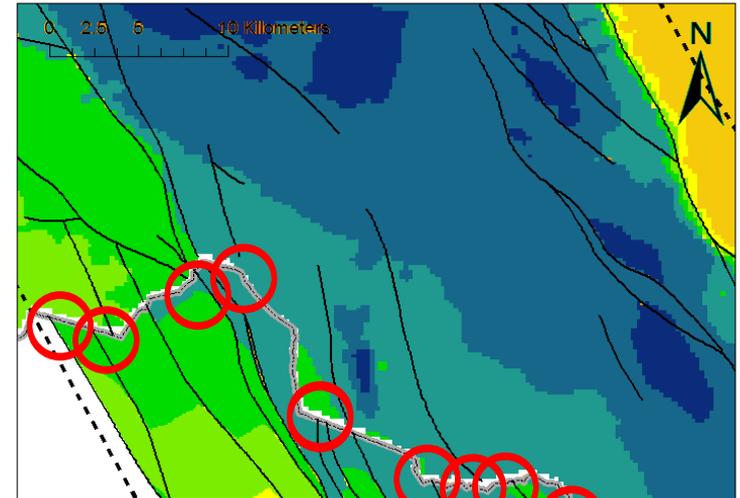

Model area = 1950 km²

-  fault zones
-  modelled H3O-area

Inconsistencies between models along the frontier

- » Different (hydro)geological classification systems (i.e. nomenclatures)
- » Non-matching of faults
- » Jumps in depth and thickness of (hydro)geological units
- » Differences in detail between (hydro)geological models

Goals H3O-project

Main goal

“To attune jointly the geological and hydrogeological models of the Netherlands and Flanders along the frontier”

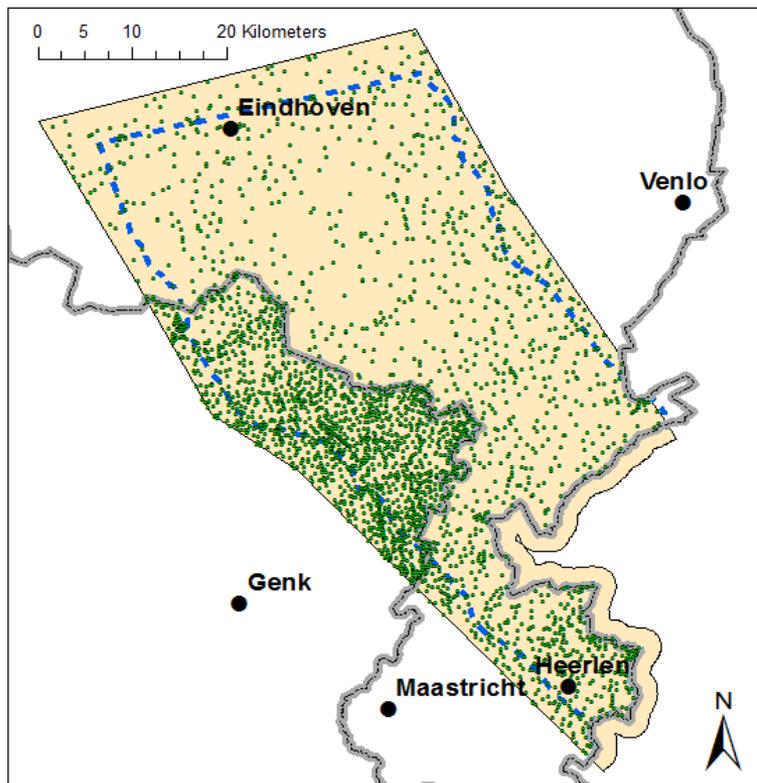

Specific goals pilot project H3O-Roer Valley Graben

- › *One cross-border 3D **geological and hydrogeological layer model***
- › *Of the **Cenozoic** (to about 1800 m depth)*
- › *Of the **Roer Valley Graben** in Southeast Netherlands and Northeast Flanders*
- › *Based on existing raw data*

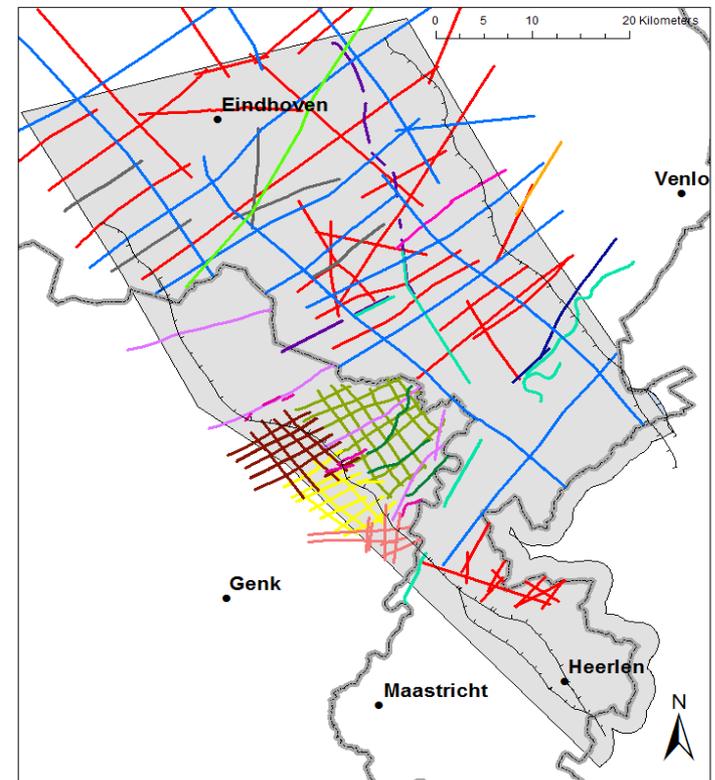

Data inventory and collection – the main primary data

Well data

n = 2939

2D Seismic data

Correlation of Dutch and Flemish (hydro)geological units – some examples

Results – old versus new geological models

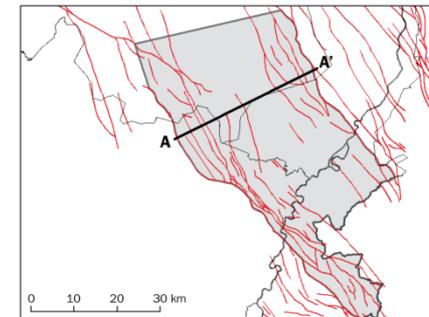

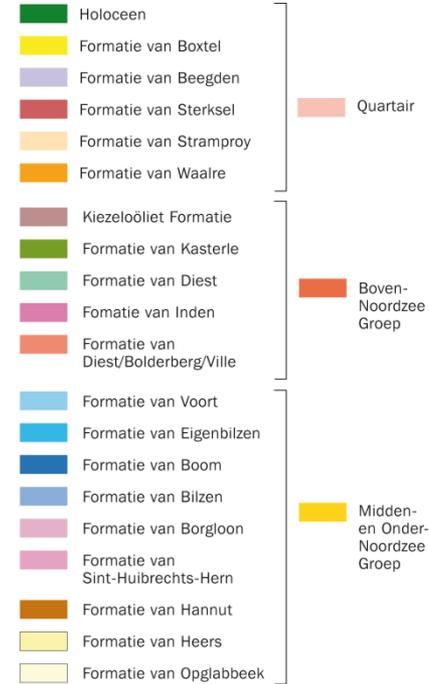

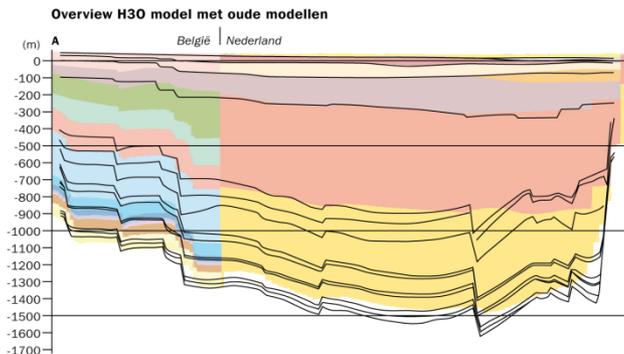

Old models

New model

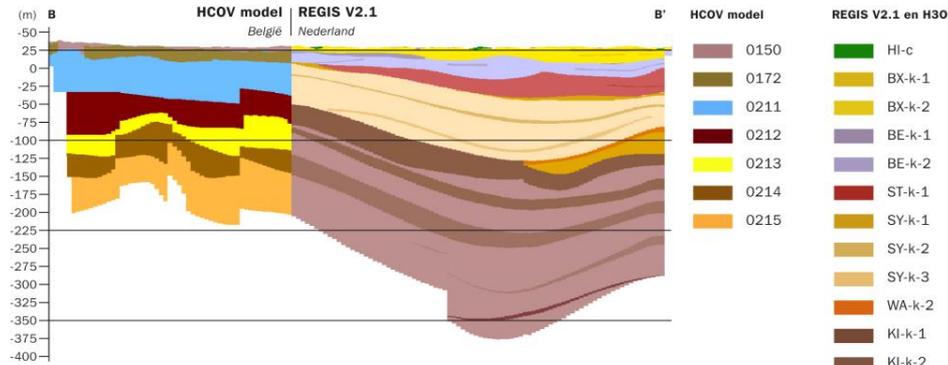

Improvements

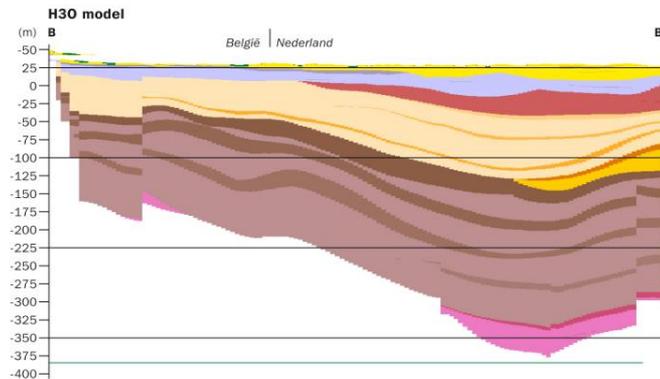

Results – old versus new hydrogeological models

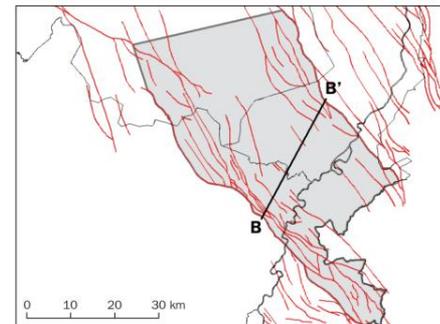

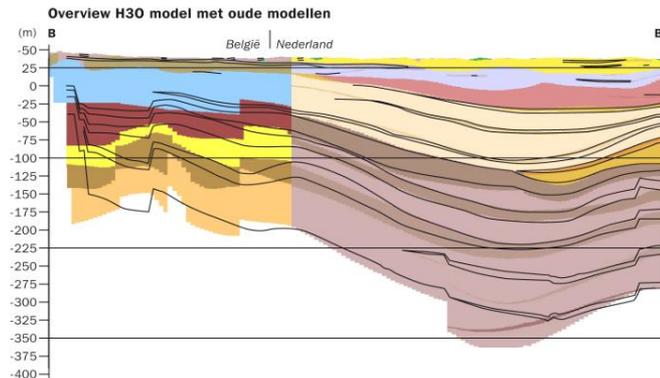

Old models

New model

Improvements

Main conclusions

- » Workable correlation between Belgian and Dutch (hydro)geological units.
- » Workable modelling approach resulting in one geological and one hydrogeological model of the Cenozoic of the entire model area.
- » Without inconsistencies along the frontier.

Final results available online in Flemish and Dutch subsurface databases

H3O-Roerdalslenk is een (hydro)geologisch 3-dimensionaal model van de ondergrond van de Roerdalslenk. Het grensoverschrijdende karakter van de modellering staat centraal. Daarbij werden de Cenozoïsche (Quartaire, Neogene en Paleogene) afzettingen in het Nederlands Limburgse, het zuidoostelijk Noord-Brabantse en het Vlaamse deel van de Roerdalslenk gemodelleerd.

De resultaten van H3O-Roerdalslenk werden opgeleverd in zowel het Nederlandse als het Belgische coördinatenstelsel en referentieniveau. Voor Vlaanderen is dit het referentiestelsel Belge Lambert 1972 en TAW (Tweede Algemene Waterpassing) en voor Nederland in RD en NAP (Nieuw Amsterdams Peil).

Het H3O-Roerdalslenk-project werd in 2012 opgestart en gepubliceerd in juli 2014.

Downloads project H3O Roerdalslenk

In het kader van dit project is een grensoverschrijdend, up-to-date, driedimensionaal geologisch en hydrogeologisch model van het Limburgse, Zuidoost-Brabantse en Vlaamse deel van de Roerdalslenk gemaakt. Hier kunt u de resultaten van dit project downloaden. Deze resultaten bestaan uit het eindrapport en de digitale datasets van beide modellen (in het Nederlandse RD-coördinatenstelsel en NAP-referentieniveau). Beide modellen zijn op de website van de Databank Ondergrond Vlaanderen (DOV) ook beschikbaar in het Belgische Lambert-coördinatenstelsel en TAW-referentieniveau. Daarnaast kunt u op deze pagina het programma en de presentaties downloaden van de op 13 maart 2014 in het Gouvernement te Maastricht gehouden eindpresentatie van het project.
