

WI-GIM Life: Wireless Sensor Network for Ground Instability Monitoring

The technology

Speaker: Ing. Federico Trippi, Ph.D.
Assistant Project Manager

WORKSHOP

Monitorització del terreny com a eina de gestió del risc
i presentació del Projecte Europeu Wi-GIM

Institut Cartogràfic i Geològic de Catalunya

Barcelona, 27 January 2017

WI-GIM Life Project (LIFE12/ENV/IT001033)

▶ Wireless Sensor Network for Ground Instability Monitoring

Beginning date: 01/01/2014

End date: 31/03/2017

Total Budget of the project: € 1.043.090 (EU Contribution 49%)

▶ Coordinating Beneficiary:

International Consortium on Advanced Design (ICAD) - Italy

▶ Associated Beneficiary:

▪ **Earth Science Department – University of Florence (DST) - Italy**

▪ **Institut Cartogràfic i Geològic de Catalunya (ICGC) - Spain**

▪ **Istituto Nazionale di Geofisica e Vulcanologia – Sez. Pisa (INGV) - Italy**

▪ **Regione Emilia-Romagna (RER) - Italy**

Landslide monitoring technology

SURFACE CONTACT TECHNOLOGY

Extensometer
Inclinometer

Disadvantage:
INSTALLATION

REMOTE SENSING TECHNOLOGY

SAR Systems

Disadvantage:
COSTS
INSTALLATION

WSN

Wireless Sensor Network

Cost effective node

Easy and quick installation

Good Accuracy (it depends from technology)

WI-GIM Life major technology Innovation

WSN + RANGING RADIO

Wireless Sensor Network benefits

+

**Sensor node distance measurement
with radio frequency technology**

WI-GIM Life: Ranging technology

WI-Gim Node

Ranging +
Data Nodes
communication

Hi Precision
Ranging

Absolute position

Data web access

Ultra Wide Band

LAB TEST RESULTS

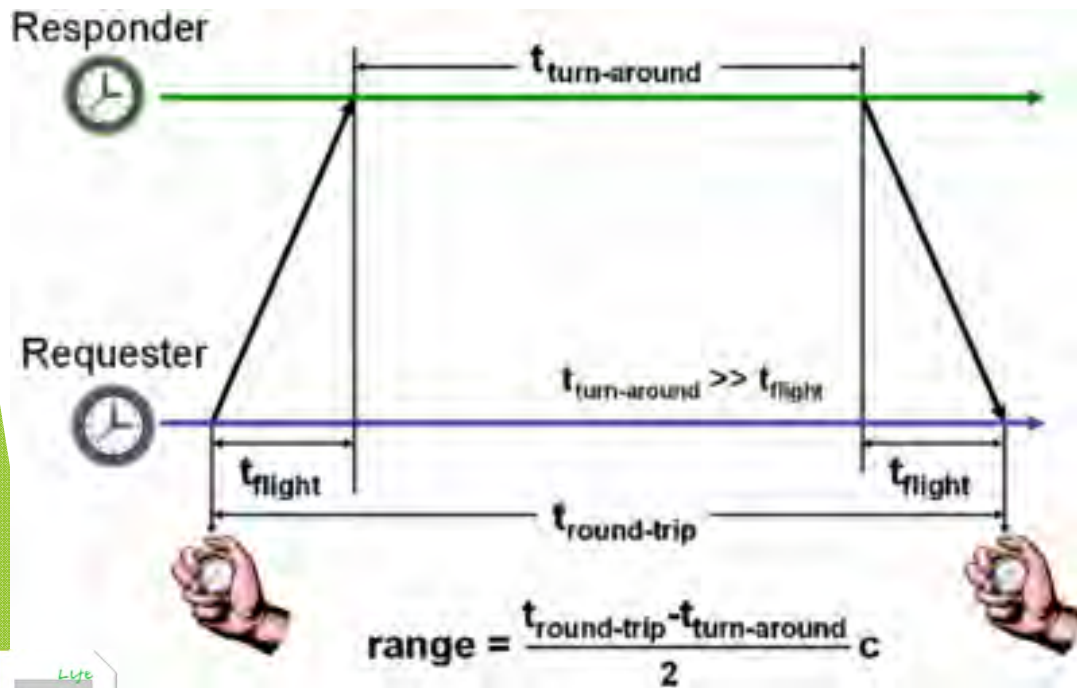

Accuracy: ± 8 cm

Coverage: 150 m (LOS)

Ranging + Communication

Ultra Wide Band

FMCW Radar

LAB TEST RESULTS

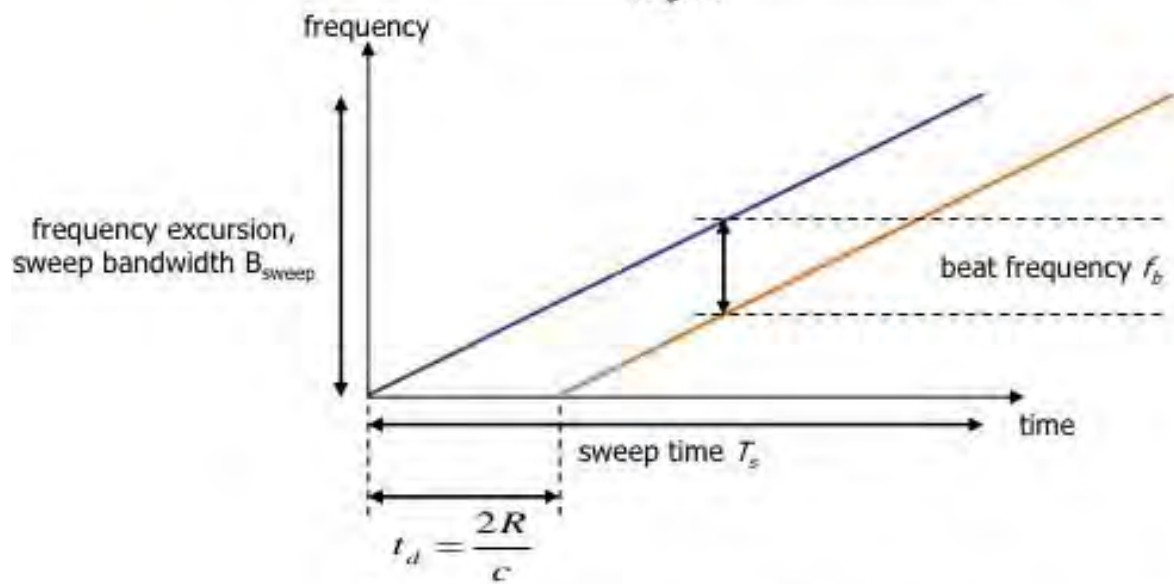

Accuracy: ≈ 8 mm

Coverage: ≈ 70 m

(LOS) It depends on the target surface area

FMCW Radar

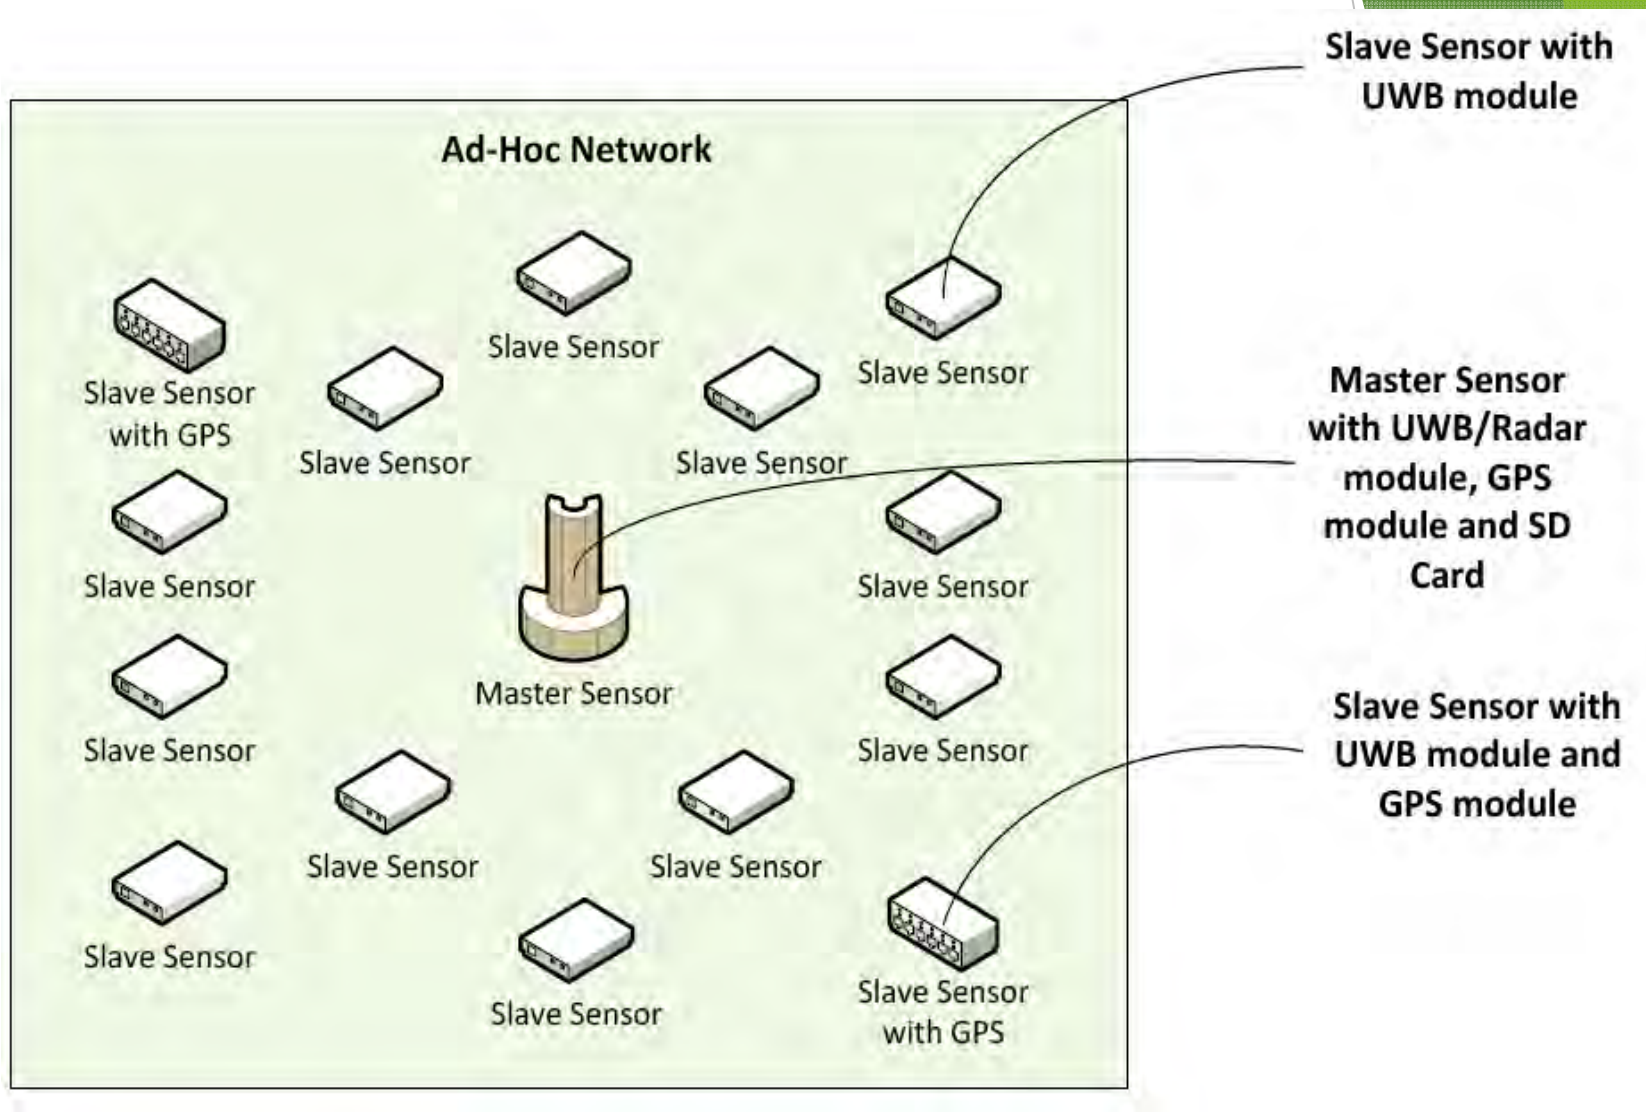

$$\frac{t_d}{T_s} = \frac{f_b}{B_{sweep}}$$

$$R = \frac{c T_s f_b}{2 B_{sweep}}$$

WI-GIM Life: General architecture

WI-GIM Life: Benefits of ad hoc networks

The architecture has been designed as an ad-hoc sensors network

- **Cluster-based**
 - ✓ **Independent clusters**
 - ✓ **Non-contiguous areas can be monitored at the same time**
 - ✓ **More flexibility**
 - ✓ **More scalability**
 - ✓ **More adapt to future upgrades**

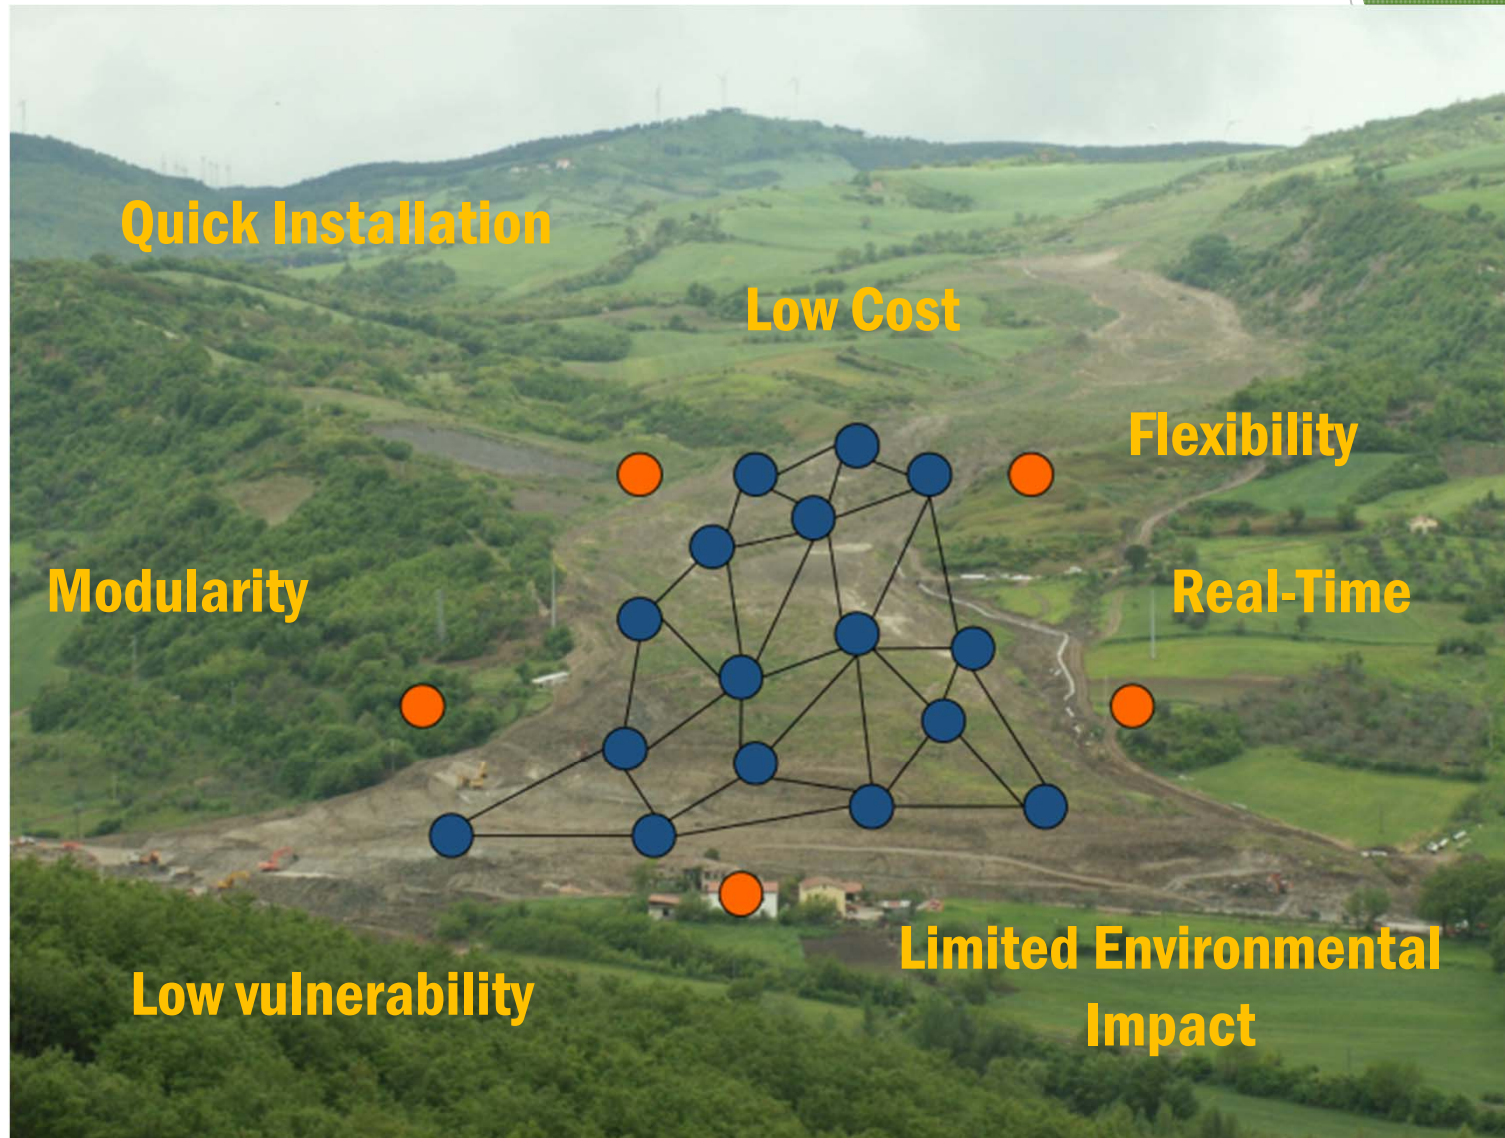

- **No need for a “stable” area**
- **User-friendly configuration wizard**
- **Remote alarms**
- **Remote periodical report**

WI-GIM Life: Project Idea

WI-GIM Life: Project Idea

Quick Installation

Low Cost

Flexibility

Modularity

Real-Time

Low vulnerability

Limited Environmental Impact

WI-GIM Life: Prototype Development

MASTER

SLAVE

WI-GIM Life: Prototype Testing

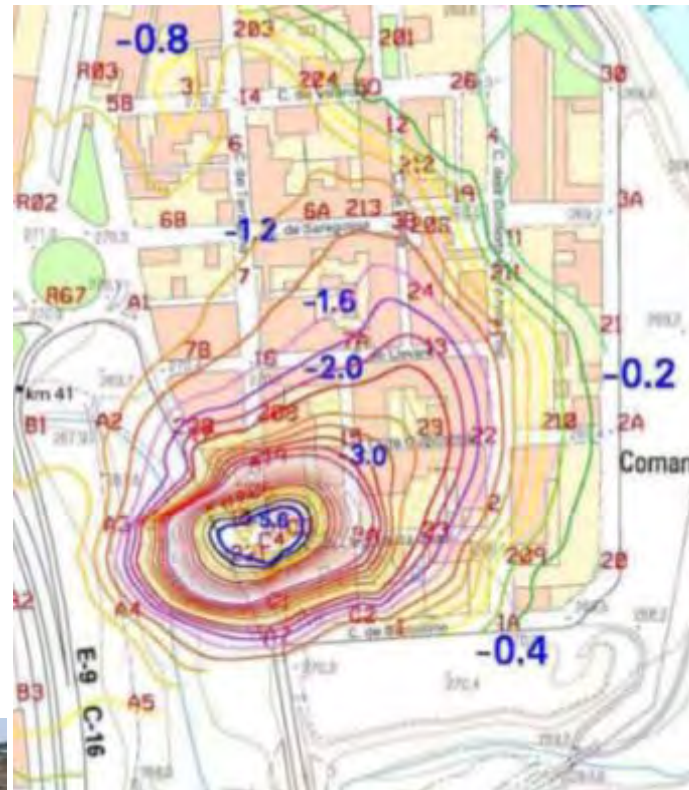

Barcelona 27 January 2017 WI-GIM Life

WI-GIM Life: Roncovetro Experimental Site

WI-GIM Life: Sallent Experimental Site

Master Node UWB

Master Node
Radar

WI-GIM Life: Technology

System Offsets

- Compensation of Sensitivity of Decawave UWB algorithm

Outliers

- Algorithms for identification and compensation of outliers have been developed

Electronic noise depends on temperature

- It has been compensated with data post-elaboration

Compact and resistant chassis

- Atmospheric agent resistant (snow, rain, humidity)

System Power Consumption

- Event-driven wake-up firmware algorithms have been developed to perform energy saving on battery
- Solar Cell add-on available

WI-GIM Life: Technical Results

ACCURACY OF RAW-DATA HIGHER THAN EXPECTED

THE SYSTEM WORKED WELL IN EXPERIMENTAL SITE

- Early warning possible device for fast landslides (type 3-7)

WEB DATA POST-PROCESSING CAN FURTHER REDUCE THE ERRORS

HIGH POTENTIAL OF INDUSTRIALIZATION

- Device can be much smaller in the final version
- Energy consumption can be much less with further hardware and software optimization

THANK YOU FOR YOUR ATTENTION
