Workshop "Implementation and potential of INSPIRE coverage data and WCS" - 30th September 2016 - INSPIRE Conference 2016, Barcelona.

Summary

WCS is a service explicitly designed to deliver and exploit coverage data.

For user convenience, data providers may offer all data files based on a common grid (defined in a specific CRS, with predefined resolution levels) and range type, as one side offers the opportunity to request only a subset of it. Nevertheless, the coverage may be tiled for increasing efficiency of data access.

WCS allows hiding the complexity of tiles from the user so that any subset can be requested from the server – reassembled to the desired result. Such a result can be internally tiled at a suitable data format such as TIFF which supports internal tiling.

Featured outcomes

• Encoding examples

3) Section 9.4.1.2 – “Default encoding(s) for application schema ElevationGridCoverage (coverage data)” of TG on EL:

- Replace the GMLCOV example currently provided in this section with the following example prepared in collaboration of Thematic Cluster #3:

Edit the full description of the example, replacing the text:

“EXAMPLE The following is a complete RectifiedGridCoverage instance (taken from [OGC 09-146r2]), using the base type RectifiedGridCoverage defined in the OGC GML Application Schema – Coverages available from <http://schemas.opengis.net/gmlcov/1.0/>.”

With the following text proposal:

“EXAMPLE The following is a complete RectifiedGridCoverage instance showing an ElevationGridCoverage using GML multipart representation.”

Note that this example shall be placed at the same level of Section 9.4.1.2 or at the level of the new subsection on “GML multipart representation” (newly proposed here - <https://themes.jrc.ec.europa.eu/pages/view/54815/clarify-structure-of-coverage-encoding-related-sections-in-tgs-default-encodings-and-alternative-encodings>).
